Imaging

Use both hands to support the device, stabilize from the forehead

Approach pupil from 5-10 cm distance keeping it in the middle and press the eye cup firmly around the eye

Approach the GRAY oval reflection at the top of the pupil until retina fully appears on display

Red aim help; retina not in full view yet. Fine-tune from the front.

Green aim help; focusing has started. Hold still.

Green rectangular in display; focusing ready. Press shutter.

After imaging

1. Press Optoroller to access image

2. Choose right/left eye to save image, or click Exit preview to save image without eye selection

3. Transfer images wirelessly via WLAN or using USB via Charging Station

4. Erase images from camera Settings > Camera > Erase image memory

Image quality issues

REFLECTIONS IN THE IMAGE

Imaging distance is too far away if there is a reflection in the bottom of the image. If the imaging distance is too close, a reflection in the top of the image appears.

IMAGE IS NOT IN FOCUS

Check the refraction value and ask the patient to fixate to the target led or use autofocus

IMAGE IS TOO DARK OR BRIGHT

Adjust the brightness of the image manually by increasing (>5) or decreasing (<5) the exposure level
